Digital Health in India
Legal, Regulatory and Tax Overview

November 2019
About NDA

At Nishith Desai Associates, we have earned the reputation of being Asia’s most Innovative Law Firm – and the go-to specialists for companies around the world, looking to conduct businesses in India and for Indian companies considering business expansion abroad. In fact, we have conceptualized and created a state-of-the-art Blue Sky Thinking and Research Campus, Imaginarian ‘Aligunjan,’ an international institution dedicated to designing a premeditated future with an embedded strategic foresight capability.

We are a research and strategy driven international firm with offices in Mumbai, Palo Alto (Silicon Valley), Bangalore, Singapore, New Delhi, Munich, and New York. Our team comprises of specialists who provide strategic advice on legal, regulatory, and tax related matters in an integrated manner basis key insights carefully culled from the allied industries.

As an active participant in shaping India’s regulatory environment, we at NDA, have the expertise and more importantly – the VISION – to navigate its complexities. Our ongoing endeavors in conducting and facilitating original research in emerging areas of law has helped us develop unparalleled proficiency to anticipate legal obstacles, mitigate potential risks and identify new opportunities for our clients on a global scale. Simply put, for conglomerates looking to conduct business in the subcontinent, NDA takes the uncertainty out of new frontiers.

As a firm of doyens, we pride ourselves in working with select clients within select verticals on complex matters. Our forte lies in providing innovative and strategic advice in futuristic areas of law such as those relating to Blockchain and virtual currencies, Internet of Things (IOT), Aviation, Artificial Intelligence, Privatization of Outer Space, Drones, Robotics, Virtual Reality, Ed-Tech, Med-Tech & Medical Devices and Nanotechnology with our key clientele comprising of marquee Fortune 500 corporations.

NDA has been the proud recipient of the RSG - FT award for 2019, 2017, 2016, 2015, 2014 as the ‘Most Innovative Indian Law Firm’ and in 2016 we were awarded the ‘Most Innovative Law Firm - Asia Pacific,’ by Financial Times (London).

We are a trust based, non-hierarchical, democratic organization that leverages research and knowledge to deliver extraordinary value to our clients. Datum, our unique employer proposition has been developed into a global case study, aptly titled ‘Management by Trust in a Democratic Enterprise,’ published by John Wiley & Sons, USA.
Accolades

A brief chronicle our firm’s global acclaim for its achievements and prowess through the years –

- **IFLR1000:** Tier 1 for Private Equity and Project Development: Telecommunications Networks. 2020, 2019, 2018, 2017, 2014
- **AsiaLaw Asia-Pacific Guide 2020:** Tier 1 (Outstanding) for TMT, Labour & Employment, Private Equity, Regulatory and Tax
- **FT Innovative Lawyers Asia Pacific 2019 Awards:** NDA ranked 2nd in the Most Innovative Law Firm category (Asia-Pacific Headquartered)
- **Chambers and Partners Asia Pacific:** Band 1 for Employment, Lifesciences, Tax and TMT 2019, 2018, 2017, 2016, 2015
- **Benchmark Litigation Asia-Pacific:** Tier 1 for Government & Regulatory and Tax 2019, 2018
- **Who’s Who Legal 2019:**
  - Nishith Desai, Corporate Tax and Private Funds – Thought Leader
  - Vikram Shroff, HR and Employment Law- Global Thought Leader
  - Vaibhav Parikh, Data Practices - Thought Leader (India)
  - Dr. Milind Antani, Pharma & Healthcare – only Indian Lawyer to be recognized for ‘Life sciences-Regulatory,’ for 5 years consecutively
- **Merger Market 2018:** Fastest growing M&A Law Firm in India
- **Asia Mena Counsel’s In-House Community Firms Survey 2018:** The only Indian Firm recognized for Life Sciences
- **IFLR:** Indian Firm of the Year 2013, 2012, 2011, 2010
- **IDEX Legal Awards 2015:** Nishith Desai Associates won the “M&A Deal of the year”, “Best Dispute Management lawyer”, “Best Use of Innovation and Technology in a law firm” and “Best Dispute Management Firm”

ANNEXURE A

Telemedicine Scenarios
1. Introduction

“I think the biggest innovations of the twenty-first century will be the intersection of biology and technology” – Steve Jobs, as told to Walter Isaacson.

In 2001, Dr. Jacques Marescaux surgically removed the gall bladder of a 68 year old woman. While thousands of these procedures are done on a daily basis, the reason this particular surgery stands out is because the surgeon was in New York, while the patient was in France. Separated by a distance of thousands of miles, this robot-assisted ‘tele-surgery’ was made possible using dedicated Asynchronous Transfer Mode (“ATM”) telecommunication technology, which provided minimum response time between the surgeon and the robot.

At a time when such activities were not even anticipated, the United States Food and Drug Administration (“USFDA”) took a very conservative approach while granting approvals for the procedure. To minimize liabilities and ambiguities, the USFDA allowed the surgery to be performed by French surgeons on a French patient while the French government was to take all the responsibilities. The whole procedure cost a whopping $11 million, but served the purpose of demonstrating to the world the potential of the amalgamation of healthcare and technology.

The world has come a long way since then, with the development of information technology culminating to a phase where such innovative procedures are steadily gaining acceptance. Healthcare technology is pushing boundaries, broadening its scope every day and with it, the opportunities. From heart rate monitors built into watches to glucose monitors integrated into contact lenses, the healthcare industry is heading into some interesting and revolutionary times.

I. What is Digital Health?

There is a popular tendency to group every technological advancement in healthcare under the umbrella of “Digital Health”. But what exactly is Digital Health?

As per the World Health Organization (“WHO”), Digital Health means “the use of information and communication technologies (“ICT”) for health”. The definition, though very concise, is not very helpful. The European Commission has put forth a more elaborate definition of Digital Health. Digital Health refers to “tools and services using information and communication technologies that can improve prevention, diagnosis, treatment, monitoring and management”. Therefore, the expression Digital Health may be safely said to include both tools and services that use ICTs for purposes connected to health.

II. What was the need to write this paper and what does it propose to do?

“The hare of science and technology lurches ahead. The tortoise of the law ambles slowly behind”

A patient survey predicts that 75% of all patients expect to use digital services in the future. With the healthcare sector expected to touch $158.2 billion by 2017, one should not harbor a doubt that Digital Health services would bite into a large portion of the pie.

However, the current legal and regulatory landscape that governs Digital Health is scattered and ambiguous. To make matters worse, there is none or very little legal scholarship in the area of Digital Health in India.

The scope of Digital Health is vast and covers various business models, which inherently makes it difficult to regulate as a whole.

This paper seeks to knit together existing laws and regulations into what may be called an “ad-hoc” legal framework for Digital Health in India. It is being written for those who are already invested in Digital Health as workforce or capital contributors as well as those who are still testing the waters.

Since this is a research paper, it also seeks to raise questions and takes positions which are yet to be tested with the hope that it would set the tone for legal discussions in larger platforms.
2. Some prominent examples of Digital Health

I. Telemedicine

75% of the country’s healthcare infrastructure is concentrated in urban areas while more than 75% of the population lives in rural areas. Telemedicine, which is the use of telecommunications technology to provide healthcare, could effectively bridge the gap between the patient and the doctor.

While telemedicine is not a separate specialty in itself, its standout is the use of various technologies in providing traditional healthcare services. It is a broad concept that covers within its ambit various aspects such as tele-radiology, tele-consultation, tele-nursing, tele-ICU and tele-surgery. Each brings its own advantages and challenges and have to be examined individually in order to be able to run the service efficiently and in compliance with the law.

II. Robot-Assisted Surgery

Using the assistance of robots, doctors are able to perform surgical procedures more efficiently. Minimally invasive surgeries have been around for a while, but with the assistance of robotics, surgeons are able to maneuver more precisely and with smaller incisions. This ultimately leads to reduced loss of blood, better pain management and quicker recovery for the patient.

With advancements in deep learning, robots would be able to observe and replicate procedures that are simple and repetitive, while the surgeon concentrates on more complex tasks.

III. Self-Monitoring Healthcare Devices

Monitors and sensors are now being integrated into wearables, which allow it to detect various physiological changes in the body. These smart devices are capable of tracking weight, sleep patterns, posture, diet and exercise. The raw data that is collected can be used to self-monitor by detecting various health symptoms and alert the user in case of potential issues.

IV. Electronic Health Records (“EHR”)

An EHR is a digital version of a patient’s health records. EHRs help eliminate the problems associated with physical records such as loss and lack of accessibility. EHRs can be stored centrally and accessed at any time, irrespective of where or when the information was collected. With EHRs, doctors are able to view their patient’s complete medical history even if they are treating the patient for the first time. This would help reduce duplication of tests and facilitate the secure exchange of information, which in turn helps the patient and the healthcare facilities manage costs.

V. Health Service Aggregation

Information asymmetry is one of the biggest challenges in healthcare. Patients are not privy to information which is essential in aiding with their choice of doctors, and at times doctors are not able to reach out to a large number of patients due to a lack of visibility. A number

---

4. IEEE Spectrum; Robot Surgeones are Taking over the Operating Room; available at http://spectrum.ieee.org/video/robotics/medical-robots/robot-surgeons-are-taking-over-the-operating-room
5. Geoff Appelboom, Elvis Camacho, Mickey E Abraham; Smart wearable body sensors for patient self-assessment and monitoring; available at http://www.ncbi.nlm.nih.gov/pmc/articles/PMC4166023/
of online platforms are springing up which attempt to solve this problem. These platforms list the names of doctors with their specialties, and allow for patients to search for and make an appointment with the right doctor to suit their specific needs. Patients are also able to rate and review the quality of the service provided by the doctor or institution, which serves as guidance for future patients to make an informed decision.

VI. m-Health

Mobile health, or m-Health, is the provision of Digital Health services on a mobile platform. India is home to the 3rd largest smartphone market in the world, which makes m-Health a very lucrative option. Providing access to such applications on smartphones would also not be a big hurdle, with the country expecting to reach 314 million mobile internet users by 2017. The convenience of Digital Health coupled with the mobility of m-Health opens the arena for a lot more players to actively take part in the revolution.

VII. Big Data in healthcare

Raw data is collected from the use of various Digital Health services. EHRs in itself generates a massive amount of information that can be put to use in different ways. 25 billion devices are expected to be connected through the Internet of Things (“IOT”), and the data that these connected devices are expected to churn out have to be processed. The sheer volume of information generated requires solutions such as big data processing, which then can be put to use by various companies.

VIII. Targeted advertising

Wearables and information provided by users generate information related to the user’s medical history and health conditions. This information can be used by companies to provide targeted advertising of products to users who are more likely to purchase or use such products. For instance, glucose monitoring products could be advertised to diabetic patients based on the medical history provided by them. Targeted advertising however, throws up various legal and ethical questions where in some instances, it is a blurred line.

IX. e-Pharmacies

An interesting concept that is cropping up worldwide is online pharmacies or e-Pharmacies. There are various models that have been adopted such as online-only pharmacies and physical pharmacies with an online presence. Online pharmacies allow pharmacists to cater to a larger group of patients as the inherent geographical restrictions on physical pharmacies are removed in the online model.

X. e-Learning in the healthcare sector

Continuous Medical Education (“CME”) being a mandatory requirement and necessary for doctors to keep in touch with the current trends and developments in the field of medicine, e-Learning is a more convenient platform for doctors to attend such programmes. E-Learning also saves on time and costs by being accessible from anywhere.

8. Vinny La Barbera; Wearable Technology and Its Impact on Internet Marketing; available at https://www.imforza.com/blog/wearable-technology-impact-on-internet-marketing/
3. Investment in Digital Health

The healthcare sector as an industry is expanding rapidly in India and has not been as severely impacted by the economic slowdown as some of the other industries.

India, one of the biggest emerging markets, is currently an important destination for Foreign Direct Investment (“FDI”).

A significantly low presence of doctors in rural and semi-urban areas has led to limited access to proper healthcare facilities for people living in these areas. Telemedicine and Digital Health are considered to be some solutions to this lack of access. The growth of the IT sector in India (which plays a crucial role in telemedicine) has led to the emergence of this sector in India. Tele-radiology has emerged as a fast growing area with an increasing number of foreign hospitals active in this space. These hospitals consult Indian experts to provide opinions, i.e., on x-rays of patients in the hospital. Many hospitals have adopted the public-private partnership route to render services through telemedicine.

Some investment options are discussed below:

I. Foreign Direct Investment

Foreign investment into India is governed by the Foreign Exchange Management Act, 1999 (“FEMA”), the rules and regulations made by the Reserve Bank of India (“RBI”), and the Industrial Policy and Procedures issued by the Ministry of Commerce and Industry through the Secretariat for Industrial Assistance, Department for Promotion of Industry and Internal Trade (“DPIIT”). The provisions pertaining to FDI are laid down in Regulation 16 of FEMA (Transfer or Issue of Security by a Person Resident outside India) Regulations, 2017.

II. Foreign Venture Capital Investment

Another vital means of investment is through venture capital investment by entities registered with the Securities Exchange Board of India (“SEBI”) as foreign venture capital investors. While it is not mandatory for a private equity investor to register as a Foreign Venture Capital Investor (“FVCI”) under the FVCI regulations, there are some significant advantages to be gained by registering as an FVCI. An FVCI is exempt from compliance with the pricing

guidelines under the Consolidated FDI Policy for the acquisition of securities at the time of entry as well as for the transfer/sale of securities at the time of exit. Secondly, in cases where the promoters of the company intend to buy-back the securities from an FVCI, they are exempted from making an open offer under the Takeover Code. It should be noted that SEBI has been granting approvals to FVCIs only for investments in certain identified sectors, amongst them being research and development of new chemical entities in the pharmaceutical sector, and units of SEBI registered Venture Capital Funds (“VCFs”). Further, the Reserve Bank of India (“RBI”) has made recent amendments to the foreign exchange control regulations to permit FVCIs to invest in SEBI registered Alternate Investment Funds (“AIFs”).

---

12. Regulation 10 of the Securities Exchange Board of India (Substantial Acquisition of Shares and Takeovers) Regulations, 2011.

13. SEBI introduced SEBI (Alternate Investment Funds) Regulations, 2012 to govern domestic pooling vehicles. RBI has issued Notification no. FEMA 355/2015 that permits AIFs and other investment vehicles to accept foreign investments under the automatic route.
4. Legal and Regulatory Framework

The laws that broadly cover Digital Health services are discussed below:

Digital Health involves a constant exchange of information between the patient and the service provider. The patient’s personal information, such as medical history and physiological conditions, are considered Sensitive Personal Data or Information ("SPDI") under the Data Protection Rules. When a body corporate collects, stores, transfers or processes such information, certain requirements under the Data Protection Rules are triggered.

Consent is one of the major requirements under the Data Protection Rules. Before a doctor or an institution does anything with a patient’s data, they are required by law to obtain the recipient’s consent in writing.\(^\text{16}\) The patient must be informed about the fact that the data is being collected, what it will be used for and whether it would be transferred to any third parties, along with the contact details of the agency collecting the information.\(^\text{17}\) There is also a requirement for body corporates to have a privacy policy in place and published on its website.\(^\text{18}\) This consent is usually obtained by having the patient accept the terms of the body corporate’s privacy policy, which is also required to have such information, in addition to the security practices the body corporate has adopted to keep the information safe.

If the SPDI is planned to be disclosed to a third party, prior permission of the owner of the SPDI is to be obtained. In cases where the SPDI is being transferred, the body corporate transferring the SPDI must ensure that the receiver of the SPDI has adequate security practices in place.\(^\text{19}\)

The Data Protection Rules also mandate the implementation of reasonable security practices and procedures in order to keep the SPDI secure. This requirement is fulfilled if the body corporate conforms to the international standard IS/ISO/IEC 27001 on “Information Technology – Security Techniques – Information Security Management System – Requirements” or similar standards that are approved and notified by the Central Government. As on date, no such standards have been notified.

There is also a requirement to appoint a ‘Grievance Officer’\(^\text{20}\), whose contact details are to be published on the website. Apart from these, there are also other requirements such as

\(^\text{14}\) Rule 3 of the Data Protection Rules defines Sensitive personal data or information of a person to mean such personal information which consists of information relating to (i) password; (ii) financial information such as Bank account or credit card or debit card or other payment instrument details; (iii) physical, physiological and mental health condition; (iv) sexual orientation; (v) medical records and history; (vi) Biometric information
\(^\text{15}\) Section 43A of the IT Act defines “body corporate” means any company and includes a firm, sole proprietorship or other association of individuals engaged in commercial or professional activities
\(^\text{16}\) Rule 5(1) of the Data Protection Rules
\(^\text{17}\) Rule 5(3) of the Data Protection Rules
\(^\text{18}\) Rule 4(1) of the Data Protection Rules
\(^\text{19}\) Rule 7 of the Data Protection Rules
\(^\text{20}\) Rule 5(9) of the Data Protection Rules
allowing users to opt-out\textsuperscript{21} or modify\textsuperscript{22} their SPDI if required.

In 2013, the Ministry of Communications and Information Technology came out with a clarification\textsuperscript{23} which stated that body corporates that were collecting, storing, processing or transferring information out of a contractual obligation were not required to observe some of the requirements of the Data Protection Rules such as obtaining consent from the owner of the SPDI for collecting or disclosing the SPDI. The other requirements, however, must still be observed.

Some Digital Health services have set ups that merely facilitate the interaction between the patient and the service provider and are not directly involved in the provision of the services. In such cases, the service provider would be considered an intermediary\textsuperscript{24} under the Intermediary Guidelines and the IT Act. There are certain relaxations that are given to intermediaries in terms of liability of third party data or communication, provided they observe certain due diligence requirements\textsuperscript{25} under the Intermediary Guidelines. These requirements are extensive, and include having a terms of use in place, removal of offending/unlawful\textsuperscript{26} material within 36 hours of a request and appointing a grievance officer. The relaxation would apply only if the intermediary does not initiate the transmission of the data/communication, select the receiver of the transmission or select or modify the information in the transmission\textsuperscript{27}.

The constitutionality of the Intermediary Guidelines and section 79\textsuperscript{28} of the IT Act were challenged before the Supreme Court in the case of Shreya Singhal v. Union of India\textsuperscript{29}, stating that these provisions were vague, broad and in violation of Article 19 of the Constitution of India, which provides for the fundamental right to the freedom of speech and expression.

It was argued that section 79 and the Intermediary Guidelines allow the intermediary the discretion to decide upon whether an unlawful/offending material is being published and that the restrictions under the Intermediary Rules go beyond the permitted restrictions under Article 19(2).

The Supreme Court read down the provisions of section 79 and the Intermediary Guidelines to mean that the intermediary must receive a court order or notification from a government agency requiring it to remove specific information. The court also stated that any such court order or notification must necessarily fall within the ambit of reasonable restrictions under Article 19(2), meaning that such removal must be in the interest of the sovereignty and integrity of India, the security of the State, friendly relations with foreign States, public order, decency or morality or in relation to contempt of court, defamation or incitement to an offence. The judgment was, however, silent on which administrative authority could pass such an order or notification.

\textsuperscript{21} Rule 5(7) of the Data Protection Rules
\textsuperscript{22} Rule 5(7) of the Data Protection Rules
\textsuperscript{24} Intermediary under the IT Act is defined as any person who on behalf of another person receives, stores or transmits that record or provides any service with respect to that record and includes telecom service providers, network service providers, internet service providers, web hosting service providers, search engines, online payment sites, online-auction sites, online market places and cyber cafes.
\textsuperscript{25} Rule 3 of the Intermediaries Guidelines
\textsuperscript{26} Rule 3(2) of the Intermediaries Guidelines

\textsuperscript{27} Section 79 of the IT Act
\textsuperscript{28} Section 79 of the IT Act provides intermediaries with exemption from liability if it meets the requirements laid down under the section
\textsuperscript{29} Writ Petition (Criminal) No.167 Of 2012
II. Other Service Providers
Regulations under the New Telecom Policy 1999 (“OSP Regulations”)

Service providers who render “Application Services” - which includes telemedicine services – using telecom resources provided by telecom service providers, are required to be registered as an ‘Other Service Provider’ ("OSP") with the Department of Telecommunications.

III. The Drugs and Cosmetics Act, 1940 ("D&C Act")
and Drugs and Cosmetics Rules, 1945 ("D&C Rules")

The D&C Act and D&C Rules regulate the manufacture, sale, import and distribution of drugs in India. In many foreign jurisdictions, there is a clear distinction between a drug that must be sold under the supervision of a registered pharmacist on the production of a valid prescription (signed by a registered medical practitioner) and those that can be sold by general retailers over-the-counter ("OTC"). OTC drugs have a different meaning in the context of Indian laws. The D&C Act requires that all drugs must be sold under a license. The D&C Rules clearly lay down which drugs can be sold only on the production of a prescription issued by a registered doctor, which implies that there is a distinction between prescription and non-prescription drugs. Drugs which can be sold only on prescription are stated in Schedules H, H1, and X of the D&C Rules.

The D&C Act states that no person can sell any drug without a license issued by the licensing authority. However, it provides for certain drugs, namely those falling under schedule K of the D&C Rules, to be sold by persons who do not have such a license. Hence, OTC drugs in the Indian context would mean only those drugs that are specified under schedule K. These broadly include drugs not intended for medical use, quinine and other antimalarial drugs, magnesium sulfate, substances intended to be used for destruction of vermin or insects that cause disease in humans or animals and household remedies, among others.

The D&C Rules also state that prescription drugs can only be dispensed on the production of a prescription which is in accordance with the provisions of the rules. For a prescription to be considered valid under the D&C Rules, it must be in writing, signed and dated by the doctor issuing the prescription.30 The prescription must also state the name and address of the person for whose treatment it is given and also the quantity to be supplied.31

IV. The Indian Medical Council Act, 1956 ("MCI Act")
and The Indian Medical Council (Professional conduct, Etiquette and Ethics) Regulations, 2002 ("MCI Code")

The MCI Act provides that only those persons who have a recognized degree in medicine and are registered with one of state medical councils have the right to practice medicine in India. The MCI Code lays down professional and ethical standards of interaction of doctors with patients. The MCI Code also specifies that efforts are to be made to computerize medical records so that they can be retrieved quickly.32 Doctors are bound by the MCI Code and are required to submit a declaration to that effect.33 The apex body currently regulating the practice of medicine is the Medical Council of India.

30. Rule 65(10)(a) of the D&C Rules
31. Rule 65(10)(b),(c) of the D&C Rules
32. Regulation 1.3.4 of the MCI Code
33. Regulation 1.A of the MCI Code
However, the National Medical Commission Act, 2019 ("NMC Act") has received Presidential Assent and will come into force soon. The NMC intends to replace the current Medical Council of India with a ‘National Medical Commission’ to regulate the medical profession. The Health Minister of India Dr. Harsh Vardhan has stated that the NMC and the other bodies set up under the NMC Act will be constituted within six months from July i.e. the date on which the NMC Act received Presidential Assent. Passing of the National Medical Commission Bill would see a change in the current regulatory framework regulating medical practitioners.

V. The Drugs and Magic Remedies (Objectionable Advertisements) Act, 1954 and Drugs and Magic Remedies (Objectionable Advertisements) Rules, 1955 ("DMRA")

The DMRA makes it punishable, with imprisonment or fine or both, to participate in any advertisements in reference to a medicine which:

i. directly or indirectly gives a false impression regarding the true character of the medicine covered in the advertisement; or

ii. make a false claim regarding a drug; or

iii. is otherwise false or misleading in any material particular regarding a drug.

Advertisements are, however, permitted to be sent confidentially to registered medical practitioners and chemists, so long as such communication bears the words ‘For the use only of registered medical practitioners or a hospital or a laboratory’ at the top of the document in indelible ink and in a conspicuous manner.

Sending unsolicited commercial communications over voice or SMS are prohibited under the TCCP Regulations and UCC Regulations. However, there is no legal bar over sending transaction messages. For example, any information sent by any company pertaining to delivery of services to be delivered to such customers would be identified as a transactional message.

VII. The Clinical Establishments (Registration and Regulation) Act, 2010 ("Clinical Establishments Act")

Establishments falling under the definition of a ‘clinical establishment’ under the Clinical Establishments Act would be required to register with the relevant authority and conform to the minimum standards as prescribed under the act. The Clinical Establishments Act is applicable in Arunachal Pradesh, Uttar Pradesh, Uttarakhand, Rajasthan, Bihar, Jharkhand, Himachal Pradesh, Mizoram, Sikkim and all Union Territories except the NCT of Delhi. Certain states such as Maharashtra and Karnataka have their own state clinical establishment legislations.
5. Intellectual Property

The Digital Health space has seen a lot of innovative products being developed. Protection of these ideas and inventions becomes essential in this highly competitive market. India’s Intellectual Property Rights (“IPR”) regime allows for such protection in various forms, notably patents, copyright, trademarks and designs.

In the context of Digital Health, development is concentrated in the areas of software applications (including mobile applications) and wearable devices. This section covers the various forms of IP protection available with such developments in mind.

I. Patent

The Patents Act, 1970 (“Patent Act”) provides for patent protection in India. The Patent Act is largely compliant with the Trade-Related Aspects of Intellectual Property Rights (“TRIPS”) and India, being a signatory, has been committed to fully adopting and implementing the provisions of the agreement.

In order for an innovative product to be considered an ‘invention’ under the Patent Act, it must fulfill three criteria – novelty, non-obviousness and utility. Apart from meeting these requirements, the inventions must also not be specifically excluded from being considered an ‘invention’ under sections 3 and 4 of the Patent Act. These exclusions include ‘a process for the medicinal or other treatment of human beings and animals’ and a ‘computer program per se’.

Behind every Digital Health application is the software that runs it, which is essentially a computer program. A computer program ‘per se’ is excluded from patentability under Section 3(k) of the Patent Act, 1970. The Indian Patent Office, however, in its ‘Guidelines for Examination of Computer Related Inventions (“CRI”)’ in 2017, states that while the CRI in itself is not patentable, it is possible for a CRI claimed in conjunction with a novel hardware to be patented, provided it meets the other requirements such as the three prong test laid down under the guidelines. Patents for software programs have been issued in the past where it involves a hardware component as well. If the technology/software fulfills these requirements, it could file for a patent and receive protection if the same is granted.

A patent may not be granted if the device or program is determined to be ‘a process for the medicinal or other treatment of human beings and animals’ under section 3(i) of the Patent Act (section 3 deals with what are not considered inventions). However, the Patent examiner’s observations in Lalit Mahajan’s patent application34 distinguished between a device and process, where ‘a device for detection of antibodies to HIV and p24 antigen of HIV in human serum or plasma’ was found to be outside of the scope of section 3(i).

II. Copyright

The Copyright Act, 1957 (“Copyright Act”) provides for copyright protection in India. Copyright can exist in the form of original literary, dramatic, musical or artistic work, cinematograph films, and sound recordings. While registering a copyright is not essential since copyright in a work exists regardless of its registration, the registration serves as prima facie evidence as to the existence of the right.

Software would fall under the definition of “computer programme” under the Copyright Act and according to section 2(o), a literary work includes computer programmes. Hence the literal part, i.e., the source code, is protected under copyright law. The copyright, however, extends to the form and substance of the work, and not the idea itself. This would mean that the idea would have to be expressed in some form of medium before it can be protected.

Clinical guidelines and data could be protected under the Copyright Act, provided that it is expressed in some form of medium. A mere compilation of data without any further effort may not be protected by copyright law. This is derived from the ‘sweat of the brow’ doctrine, where even though there may not be any originality in content such as tables or databases, copyright would subsist only when a person undertakes an independent collection of the information. The person is then entitled to have his effort and expense protected.

III. Design

Industrial designs are protected under the Designs Act, 2000 (“Designs Act”). A ‘design’ has been defined to mean only features of shapes, configurations, patterns, ornaments or composition of lines or colors that are applied to an ‘article’.35

In terms of Digital Health, the two major components that would require design protection would be the Graphical User Interface (“GUI”) of applications and the design of the devices.

GUI may be protected under the Designs Act, more specifically under Article 14-04 of the Design Rules, 2001, which covers ‘Screen Displays and Icons’. However, there have been applications by companies for registration of its GUI which were rejected. The reasoning of the authorities have been that a GUI cannot be registered as a design, as screen displays do not constitute an article, which is one of the requirements for design protection. However, some icons and user interfaces have been registered as a design under Article 14-99 (miscellaneous). A company could, therefore, apply for design protection of its GUI.

The design of various devices could also be protected under the Designs Act. However, ‘design’ under this act excludes any mode or principle of construction, or anything which is in substance a mere mechanical device. The design of the device can thus be protected provided it does not fall within the exceptions under the Designs Act.

Registration of a design under the Designs Act confers copyright protection upon the proprietor of the design. This would give the proprietor the exclusive right to apply the design to any article in any class in which the design is registered.

IV. Trademark

The Trade Marks Act, 1999 (“TM Act”) governs and protects trade marks in India. Apart from statutory protection, unregistered marks are also protected under common law. A ‘mark’ under the TM Act has been defined to include “a device, brand, heading, label, ticket, name, signature, word, letter, numeral, shape of goods, packaging or, combination of colors, or any combination thereof”.36 Any mark that is capable of being ‘graphically represented’ and indicative of a trade connection with the proprietor can be registered as a trademark. The rules formulated under the TM Act provide for the classification of trade marks. India follows the NICE Classification of Goods and Services37, which has been incorporated in the schedule to the rules. One of the classes under which a trademark can be registered is class 9, which includes computer software and computer programs”.

The ‘mark’ of a Digital Health application or device could be registered as a trade mark under the TM Act, subject to certain exclusion criteria that form grounds for refusal of the trade mark, such as being devoid of distinctive character or marks or indications which have become customary in the current language or established practice of trade.38

35. Section 2(a) of the Designs Act defines an ‘article’ to mean any article of manufacture and any substance, artificial, or partly artificial and partly natural and includes any part of an article capable of being made and sold separately

36. Section 2(m) of the TM Act

37. The Nice Classification, established by the Nice Agreement (1957), is an international classification of goods and services applied for the registration of marks

38. Section 9 of the TM Act
V. Trade Secrets

In a nascent industry such as Digital Health, ideas are everything. Business strategy and cutting-edge technology must be protected before they are disclosed, in order to prevent misuse. There are no exclusive legislations that deal with confidential information and trade secrets in India. However, judicial decisions have helped secure protection of such information, albeit with the necessity of agreements to the effect.

The first frontier of protection for any company would start right at the workplace. Confidential information that is shared with employees can be protected by means of contractual obligations tailored to protect the company’s formulae, products, databases and strategic business plans.

One of the most effective forms of contractual protection would be to enter into Non-Disclosure Agreements with employees which provide remedies in case of disclosure of sensitive business information. Companies can limit their exposure by disclosing sensitive information to employees on a need-to-know basis, providing only what is necessary for effective completion of tasks.

Non-compete clauses are another way in which companies can limit the unwanted disclosure of information. However, care must be taken while drafting such clauses as Indian courts have, in the past, treated unreasonable non-compete clauses as being unenforceable. A combination of confidentiality and non-compete clauses would add an essential layer of protection for companies, especially in the absence of legislation in this regard. Developing detailed protocols for handling confidential information would also go a long way in ensuring that such information stays within the company.
6. Taxation Regime

The power to levy direct and indirect taxes in India are distributed between the central and state governments. The Income Tax Act, 1961 ("ITA"), imposed by the central government, is the main source of direct tax, while the Goods and Services Tax Act 2017 ("GST") is the primary legislation imposing indirect tax. Earlier, indirect taxes were split between multiple legislations at the central and state levels. The GST has subsumed, *inter alia*, the following taxes:

a. Service tax,
b. Additional Customs Duty commonly known as Countervaluing Duty (CVD),
c. Special Additional Duty of Customs (SAD),
d. Value Added Tax.

Some direct and indirect taxes that may be applicable to Digital Health services are discussed below.

I. Indirect Taxes

The GST prescribes four tax slabs i.e. 5%, 12%, 18% and 28%.\(^{39}\) However, health care services provided by a clinical establishment, an authorized medical practitioner or para-medics are exempt from GST.\(^{40}\)

“Health care services” have been defined as “any service by way of diagnosis or treatment or care for illness, injury, deformity, abnormality or pregnancy in any recognized system of medicines in India...” However, health care services do not include hair transplant or cosmetic or plastic surgery unless it is undertaken to restore or reconstruct anatomy or functions of body functions affected due to congenital defects, developmental abnormalities, injury or trauma.

II. Corporate Tax

Income tax in India is levied under the ITA. While residents are taxed on their worldwide income, non-residents are only taxed on income arising from sources in India. Resident companies are taxed at the rate of 30% \(^{41}\), while non-resident companies are taxed at the rate of 40%. A minimum alternate tax is also payable, by resident and, in certain circumstances, non-resident companies, at the rate of around 18.5%.\(^{42}\)

III. Structuring investments

Foreign enterprises could make investments into the Indian companies through an intermediate holding company set up in a tax friendly jurisdiction. India has a wide treaty network and the judicious use of an appropriate offshore jurisdiction could result in benefits for the foreign company, such as a reduced or nil-rate of tax on capital gains income, reduction in withholding tax rates, etc. The choice of an offshore entity would depend on the benefits available under the treaty between India and the offshore jurisdiction and the domestic tax laws of that jurisdiction. Additional concerns include economic stability, investment protection, corporate and legal system, availability of high quality administrative and legal support, banking facilities, reputation and costs, etc.

\(^{39}\) Central Board of Excise and Customs, GST Rates, available at: https://cbic-gst.gov.in/gstgoods-services-rates.html.

\(^{40}\) Department of Revenue, Ministry of Finance Notification No.12/2017- Central Tax (Rate) available at: http://cbic.gov.in/resources/btdocs-cbec/gst/Consolidated_notification_CGST_12.pdf?sessionid=7E8EF98F7EAC9GCdE46BC6A10BB90A.

\(^{41}\) Unless otherwise specified, all tax rates are applicable to Assessment Year 2017-2018 and are exclusive of surcharge and education cess.

\(^{42}\) The exact figure is based on the amount of book profits the company makes in the relevant financial year, and includes both surcharge and education cess.
7. Liability and Dispute Resolution

The liabilities that could arise for contraventions of the various legal requirements can be civil or criminal in nature, and different for doctors running the services and for service providers such as online platforms, institutions, etc.

I. Suits before a Civil Court

Civil suits could arise out of a breach of contractual obligations between the Digital Health service provider and the patient/user. It could also be instituted due to the commission of a tort such as negligence on the part of the service provider or its employees.

A breach in contractual obligations could lead to payment of damages that are either decided at the time of execution of the contract (liquidated damages) or based on the decision of the court (unliquidated damages).

In the case of negligence, the Supreme Court has explained it to mean a “breach of a duty caused by the omission to do something which a reasonable man, guided by those considerations which ordinarily regulate the conduct of human affairs would do, or doing something which a prudent and reasonable man would not do.”

To establish negligence in a civil suit, it must be proved that there was: (1) A legal duty to exercise due care; (2) a breach of that duty; and (3) consequential damage due to the breach.

In the context of a doctor-patient relationship, as would be the case in many Digital Health services, the Supreme Court has held that a “person who holds himself out ready to give medical advice and treatment impliedly undertakes that he is possessed of skill and knowledge for the purpose. Such a person when consulted by a patient owes him certain duties, viz., a duty of care in deciding whether to undertake the case, a duty of care in deciding what treatment to give or a duty of care in the administration of that treatment. A breach of any of those, duties gives a right of action for negligence to, the patient.”

II. Vicarious Liability

In the provision of Digital Health services where there is an employer-employee relationship, the employer could also be proceeded against due to the principle of vicarious liability, where the employer is deemed to be vicariously liable for acts and omissions of the employee arising in course of his/her employment. This would not usually be the case in an employer-independent contractor relationship, where the service provider does not have much control or supervision over the acts of the independent contractor.

III. Liability under the Consumer Protection Act, 1986 (“CPA”)

The CPA was enacted with a view to allow for consumers to address their grievances rather than having to go to a civil court, which turns out to be a very expensive and time consuming affair. The CPA allows consumers to claim compensation from service providers in case there is a deficiency in the service that is provided. Apart from deficiency of services, consumers can also institute claims for defective products and unfair trade practices. Consumer forums have been set up at the district, state and national level in order to hear such matters.

Earlier, there was some ambiguity with regard to whether medical services provided by doctors, hospitals or other institutions were covered under the ambit of the CPA. The Supreme Court

44. Laxman Balkrishna Joshi v. Trimbak Bapu Godbole and Anr. 1969 SCR (1) 206

© Nishith Desai Associates 2019
in the case of Indian Medical Association v. V. P. Shantha and Ors. 45 clarified the position and held that medical services would fall within the ambit of the CPA, provided the patient is being charged for the service.

One of the essential elements to a claim is the payment for the services, as the CPA excludes services that are performed free of charge. However, a notable exception that was discussed in the V. P Shantha case was in situations where the service rendered is usually chargeable, but waived in certain cases such as for persons who cannot afford it. In such cases, the person who received the services without charge would still be able to institute a claim under the CPA.

For claims raised with consumer forums, there is no limit to the amount of compensation that can be sought. While the quantum of compensation granted varies, the average compensation is between INR 2 Lakh to INR 6 Lakh. There have also been instances where compensations of up to INR 11 crore 46 have been granted in medical negligence cases.

The Consumer Protection Act, 2019 (“CPA 2019”) has received Presidential Assent and is expected to come into force soon. The CPA 2019 sets up a Central Consumer Protection Authority as a regulator in the consumer law space. The CCPA is empowered to take up consumer cases on its own without the institution of a complaint by a consumer.

Currently, there is some ambiguity with respect to whether healthcare services are covered under the CPA 2019. An earlier version of the consumer protection bill passed by the Lok Sabha in 2018 (“CP Bill 2018”) explicitly included healthcare in the definition of service. 47 However, the CPA 2019 does not mention healthcare explicitly in the definition of services. 48 The ambiguity arises because even though healthcare is not explicitly included as a service under CPA 2019, it is also not explicitly excluded. The definition of services under CPA 2019 includes services not explicitly listed out in the definition.

IV. Disciplinary Action by the MCI

A consumer is entitled to raise a complaint with the relevant state medical council against a doctor for professional misconduct. If a complaint against a doctor has not been decided by the state medical council within six months from the date of receipt of the complaint, the MCI may, on its own or on the request of the consumer, impress on the relevant state medical council to decide on the complaint or refer the same to the Ethical Committee of the MCI for expeditious disposal. 49 Consumers who are aggrieved by the decision of the state medical council also has the right to appeal to the MCI within a period of 60 days from the date of the order passed by the state medical council. 50

Instances of professional misconduct are specified in the MCI Code, such as non-maintenance of medical records 51, refusing treatment on religious grounds, performing operations without written consent 52, etc. These are not exhaustive and complaints can be made for acts or omissions that are not covered under the MCI Code as well. If a complaint is found to be valid, the doctor faces the risk of suspension or cancelation of his/her medical license.

49. Regulation 8.7 of the MCI Code
50. Regulation 8.8 of the MCI Code
51. Regulation 7.2 of the MCI Code
52. Regulation 7.16 of the MCI Code
V. Criminal Liability

Criminal prosecution takes place before criminal courts for grounds such as the commission of offences under any criminal statute, most notably the Indian Penal Code, 1860 ("IPC").

In the case of Digital Health services, if a person is rash or negligent in rendering a service and the service results in bodily injury or death of the patient/user, the person may face criminal prosecution. The common charges faced by doctors and other providers of such services are causing death by negligence 53, act endangering life or personal safety of others 54, causing hurt by an act endangering life or personal safety of others 55 and causing grievous hurt by an act endangering the life or personal safety of others. 56 In case a person is convicted under a criminal charge as described above, he/she may face imprisonment as well as fine.

Unlike criminal prosecution in ordinary cases, criminal prosecution in cases of medical negligence only takes place when the negligence is "gross" in nature. In fact, the Supreme Court has taken a sympathetic view towards criminal prosecution of doctors. In the words of the Supreme Court, "if the hands be trembling with the dangling fear of facing a criminal prosecution in the event of failure for whatever reason whether attributable to himself or not, neither a surgeon can successfully wield his life-saving scalper to perform an essential surgery, nor can a physician successfully administer the life-saving dose of medicine." 57

A special exception has been carved out by the Supreme Court for initiation of prosecution in medical negligence cases. A criminal prosecution cannot be initiated unless there exists credible opinion of another doctor to support the charge of rashness or negligence on the part of the accused doctor.

Another special exception that has been carved out by the Supreme Court is in matters of the arrest of doctors. The Court has laid down that “a doctor accused of rashness or negligence, may not be arrested in a routine manner (simply because a charge has been levelled against him) unless his arrest is necessary for furthering the investigation or for collecting evidence or unless the investigation officer feels satisfied that the doctor proceeded against would not make himself available to face the prosecution unless arrested.” 58.

The principle of vicarious liability does not apply to criminal prosecutions. This would mean that the institutions/online platforms that provide the Digital Health services would not be criminally liable for the acts of its employees.

8. Digital Health in Foreign Jurisdictions

In most jurisdictions around the world, regulators are still working on addressing Digital Health technology and services from a legal standpoint. One of the first questions that invariably arises is whether such technology should be fit into the current legal framework meant for conventional healthcare devices and services, or whether there is a need to address it with more individualized and comprehensive regulations. The progress and outlook of various countries towards Digital Health have been discussed below.

I. United States of America

Various states in the United States of America (“USA”) have passed telemedicine specific regulations. The District of Columbia, for example, has dedicated telemedicine rules incorporated into its municipal regulations.59 The proposed rules place obligations on the physicians such as obtaining patient consent for the telemedicine services, archival and retrieval of patient records and implementing quality oversight mechanisms. The rules also propose to amend certain definitions in order to integrate and recognize telemedicine services into the municipal code.

Actions at the state level have addressed some concerns that arise from the practice of telemedicine. Some of these have been discussed below:

A. Cross-State Licensing

Licensing of medical practitioners in USA is state-bound, which requires a medical practitioner to apply for a separate license in order to practice in another state. This becomes an issue when the patient is located in one state while the medical practitioner is located in another. In order to address this, some state medical boards such as Alabama have been permitted to issue ‘special purpose licenses’ to practice medicine across states and provide telemedicine services.60 In certain other states, such as the District of Columbia, doctors are required to be licensed in the state where the patient is located, with limited exceptions for consultations. While representations for a better system have already been initiated, it may take some time before a system catering specifically to Digital Health services is set up.

B. Reimbursements

The American Telemedicine Association (“ATA”) - a leading not-for-profit organization helping to transform healthcare by improving the quality, equity and affordability of healthcare throughout the world – has been one of the biggest proponents of integrating telemedicine into the existing healthcare systems that are in place in USA. One of the major pushbacks that USA is dealing with currently for better adoption of the technology is the lack of coverage of such services in insurance policies. Certain policies go to the extent of specifically excluding Digital Health services such as telemedicine from its coverage. The ATA along with other organizations have been pushing for states in USA to pass parity laws that will allow for private insurance coverage of telemedicine.61 More than 30 states have passed such enactments, while some other states have introduced bills for the same. This would go a long way in ensuring better adoption of Digital Health services, since insurance coverage is a major consideration in USA.

60. The Federation of State Medical Boards; Telemedicine Licensure; available at: www.fsmb.org/pdf/GRPOL_Telemedicine_Licensure.pdf

C. Patient privacy and confidentiality

In terms of patient privacy and confidentiality, sharing of information and other critical aspects have been covered under the Health Insurance Portability and Accountability Act and the Health Information Technology for Economic and Clinical Health Act. Amendments to federal privacy and security laws in 2013 now requires all subcontractors having access to protected health information must now be compliant with all applicable laws, which ensures that sensitive data is accorded the same level of protection regardless of where the data is transferred.

D. Online prescriptions

States have come up with regulations which either list the medicines that are permitted to be prescribed over telemedicine or list medicines that are prohibited from being prescribed over such platforms. Some states require prescriptions to be issued only after an actual physical examination is conducted on the patient. The state of Minnesota, for example, requires referring practitioners to have performed an in-person examination of the patient before a medicine can be prescribed.62

E. m-Health

In the m-Health and telemedicine space, the USFDA has been playing an active role in addressing the new technology.63 The USFDA has divided mobile applications into three categories - mobile applications that are considered medical devices and subject to USFDA regulations, mobile applications that may be considered medical devices, but which the FDA does not currently intend to regulate, and mobile applications that could be used in a health care environment, but are not considered medical devices.

USA still has some regulatory overlaps that it needs to iron out, but regulators have understood and acknowledged the importance of Digital Health and its potential, and are working towards adapting the current legal framework to fit these new requirements.

II. European Union (EU)

The EU has been studying Digital Health in its various forms from as early as 2008, with its European Patients Smart Open Services Project. It has been working towards improving citizens’ health and increasing healthcare quality and access by making Digital Health part of the health policy and coordinating EU countries’ political, financial and technical strategies. Over the years, the EU has come out with multiple recommendations, guidelines and suggestions for cross border Digital Health services. Aspects such as insurance, data privacy, competition, electronic health records and integration of Digital Health services have been examined extensively. In 2014, a report was published with an overview of the national laws on electronic health records in the EU Member States and their interaction with the provision of cross-border Digital Health services.64 The report contained recommendations such as the content to be included in health records, placing legal obligations on doctors to update health records, safeguards for accessing health data and the interoperability of health records.

III. Australia

The Australian government has a dedicated arm for digital health – the Australian Digital Health Agency (‘ADHA’).65 Standards Australia, a

63. FDA, Mobile Medical Applications: Guidance for Industry and Food and Drug Administration Staff, Sept. 25, 2013.
64. Overview of the national laws on electronic health records in the EU Member States and their interaction with the provision of cross-border eHealth services; available at: http://ec.europa.eu/health/ehealth/docs/laws_report_recommendations_en.pdf
government-recognized standard setting organization in Australia, has laid down an exhaustive set of standards for various aspects of Digital Health, covering communications, data security, health concept representation, health record interoperability, patient administration messaging, prescription messaging and telehealth.66

The ADHA has set up a “My Health Record” System, with healthcare practitioners and organizations registering onto the platform in order to be placed into the Healthcare Identifiers Service and to obtain a Public Key Infrastructure Certificate to access the My Health Record System. My Health Record is a centralized, secure online summary of patient health information. Patients are able to control what goes into it, and who is allowed to access it by choosing to share health information with specific doctors, hospitals and other healthcare providers.67 While registration is not mandatory, organizations and doctors will not be able to have full access to the My Health Record System unless registered.

IV. China

The National Health and Family Planning Commission of the People’s Republic of China (“NHPC”) in 2014 came out with a set of interpretations and associated guidelines (titled “Opinions of the National Health and Family Planning Commission Regarding Promoting Medical Institutions’ Telemedicine Services”) related to telemedicine services in China. The guidelines actively promote the use and development of telemedicine services in China, while also covering essential points such as the need to ensure quality and efficiency as well as supervision and oversight in the performance of such services.

9. Current Issues and Considerations

I. General Considerations

A. Cross-State and Cross-Border Tele-Consultations

There seems to be some dichotomy with regard to the extent to which a license to practice medicine applies. The MCI Act states that a person whose name is a part of the Indian Medical Register, which is a central register maintained by the MCI, is entitled to practice as a medical practitioner in any part of India, subject to any other conditions laid down under the MCI Act. However, certain state medical council legislations expressly prohibit the practice of medicine within the state unless the medical practitioner is registered with the relevant state medical council.

One concern that state medical councils may have would be in relation to which council would be required to try a violation by a medical practitioner – the state in which the practitioner is registered or the place in which the violation took place. However, the Supreme Court in the case of *Malay Ganguly v. Medical Council of India and Ors* had considered the question of liability when a medical practitioner commits an offence while practicing in an area that is outside of the jurisdiction of the relevant state from which he/she received registration. The question was sent to the MCI for deliberation, and in the meeting of the ethics committee held from 26th to 28th August, 2004, the matter was taken up for consideration. The ethics committee observed “as such there is no necessity of registration in more than one State Medical Council because any doctor who is registered with any State Medical Council is automatically borne on the strength of the Indian Medical Register and also by virtue of Section 27 of the MCI Act, a person who is borne in the Indian Medical Register can practice anywhere in India”. The committee also laid down how complaints against a medical practitioner were to be dealt with when the medical practitioner was registered with more than one state. Unfortunately, the ambiguity regarding registration was not conclusively put to rest.

Since the ambit of a telemedicine practice would be to provide medical services that are not restricted to the location of the patient, it is unclear whether a doctor registered with a state medical council would be permitted to provide medical services to patients residing in another state, and whether such doctors would be required to obtain multiple state registrations in order to be entitled to practice.

Regulators may consider adopting some of the practices being followed by USA in terms of special licensing for the purpose of telemedicine, which would bring some clarity and aid medical practitioners and healthcare institutions in being compliant with regulatory requirements.

B. Prescribing Drugs

Doctors must exercise caution while prescribing drugs through a telemedicine platform. Apart from IT Act requirements relating to the validity of a prescription (discussed under the e-Pharmacies section), Indian courts have stated that prescriptions should not ordinarily be given to a patient without actual examination. They have also observed that the tendency to give prescriptions over the telephone should be avoided, except in cases of emergency.

C. Delivery of drugs

Home delivery of medication may face challenges from a pharmacy regulation perspective. The Pharmacy Practice Regulations, 2015 (“PPR Regulations”) – which regulates the

68. 2004 (1) SCC 305

69. Martin F. D’Souza v. Mohd. Ishfaq; (2009) 3 SCC 1
practice of pharmacy by registered pharmacists in India - state that prescription drugs are to be handed over to the patient or his caretaker directly by a registered pharmacist. Thus, it becomes practically challenging in an online set-up to have pharmacists deliver medication directly to patients.

D. Jurisdictional issues

Since Digital Health services are not location-specific, service recipients are distributed around the country. This becomes an issue in the case of an untoward event which leads to a suit being filed in a civil, criminal or consumer court. The plaintiff – the aggrieved patient in this case – is entitled to institute a suit at a forum where he or she is situated, which requires the provider of the service to have to travel to the location in which the suit has been instituted. This also acts as a deterring factor for practitioners who are on the fence regarding the adoption of Digital Health services in their practice, as there is a constant risk of having to travel to any part of the country to appear before the relevant forum if a case is instituted.

II. Model-specific Considerations

Digital Health being a very broad concept, the legal considerations for each model are diverse. This paper focuses the legal and regulatory framework of three major models that are picking up momentum in India – telemedicine, m-Health and e-Pharmacies.

A. Telemedicine

The most common form of telemedicine seen today is tele-consultation. Doctors sitting in one state are able to provide consultation to patients residing in the most remote locations. The barriers that once restricted access to quality healthcare have now been reduced significantly with the help of telemedicine services. While there are many services popping up around the country, care must be taken that the services provided are in compliance with the legal and regulatory requirements.

Annexure A provides a schematic representation of a few telemedicine scenarios. While not formally regulated so far, rules governing telemedicine are under development. In a typical telemedicine setup, there would be exchange of patient information, interaction between a doctor and a patient and the involvement of an intermediary in certain cases. Each of these components have their own legal considerations under various legislations.

i. Informed Consent

Consent while handling SPDI is one of the most essential compliance requirements under Data Protection law. The SPDI of patients that is collected, stored, transferred or processed must be in accordance with the Data Protection Rules. Informed consent of the patient/user is an essential requirement before such data is collected or processed.

ii. Privacy Policy and Due Diligence Requirements

The service provider is also required to have a privacy policy in place in accordance with the Data Protection Rules. In case the service provider is an intermediary, there is also a requirement of a terms of use and compliance with certain due diligence requirements in order to be protected from violations of the IT Act and its rules by users of the service.

iii. OSP Registration

Telemedicine services have specifically been covered under the OSP Regulations. While there are no express penalties for non-compliance with the regulations, there is still a legal requirement to register the service. Applications for registration under the OSP Regulations are to be made with the Department of Telecommunications.
B. m-Health

With the number of smartphone users on the rise, m-Health applications have a lot of potential. However, service providers utilizing this model must keep certain considerations in mind.

SPDI of users are collected on a real-time basis, which makes protection of such data a challenge. Users would also rely heavily on these applications and the information it provides, which makes accuracy an essential element. Service providers may face inevitable issues such as server downtime, inability to communicate with the device, etc. To protect both the user as well as the service provider, certain disclaimers must be put in place that informs the user of the accuracy of the information provided and the possibility of errors, mechanical or otherwise.

C. e-Pharmacies

Regulation of e-pharmacies has been hotly debated. There are multiple challenges to dispensing drugs online under the current framework. In its current form, the D&C Act requires that all drugs must be sold under a license. Thus, general retailers in India cannot sell drugs, except for a limited class of medicines such as gripe water, which can be sold without a license. Moreover, a drug can only be dispensed by a registered pharmacist to either the patient or his/her caretaker. The abovementioned requirements make it difficult for e-pharmacy retailers to deliver drugs to patients. Additionally, the D&C Rules require a prescription to be in writing and signed by a registered medical practitioner. Under the IT Act, a document that is required by law to be in writing would be deemed to be in compliance of such law if the same is made available in an electronic form and accessible in a way that it can be used for future references.70 Hence a prescription uploaded online would fulfill the first requirement of a valid prescription under the D&C Rules. However, the IT Act further states that where a law requires for a document to be signed, it would be deemed to be in compliance only if such information or matter is authenticated by means of an electronic signature.71 Affixing an electronic signature to any document thus becomes essential for it to fulfill a legal obligation mandating a regular signature. This would imply that uploading a scanned copy of a prescription may not be recognized as valid under law.

Other regulatory issues for e-Pharmacies would include having to satisfy the requirement of dispensing prescription medication only on the production of a valid prescription. Measures must also be put in place whereby a prescription drug is not dispensed more than once against the same prescription. For a prescription to be considered valid when it is transferred electronically - as in the case of uploading a prescription to an online pharmacy - it must comply with the provisions of the IT Act as well as the D&C Act and Rules.

In August 2018, the Ministry of Health and Family Welfare published draft rules to regulate e-pharmacies under the D&C Rules (“Proposed Rules”). The proposed amendment will introduce a licensing system for e-pharmacies and permit them to function on par with traditional pharmacies by granting them legal recognition. It also imposes conditions on e-pharmacies, such as requiring them to maintain a confidential record of prescriptions as well as details of the drugs. E-pharmacies are also required to establish a 24/7 customer support and grievance redressal mechanism, in order to address consumer complaints. Consumers are empowered to submit complaints with the regulator for violation of the license requirements (including with respect to the quality of drugs dispensed). The regulator can cancel the license of the e-pharmacy if a violation is found, in addition to other penalties prescribed.

After the release of the draft rules, both the Madras and Delhi High Court had passed orders banning online sale of medicines. However, the

70. Section 4 of the IT Act

71. Section 5 of the IT Act
Madras High Court has since then lifted the ban and directed the Government to notify the draft rules expeditiously.

e-Pharmacies in India have not been received well by existing brick and mortar set ups. The All India Organisation of Chemists & Druggists (“AIOCD”), called for a nation-wide strike in protest against online pharmacies in order to “protect the general health of the public and interest of its members”. The strike saw 8.5 lakh chemists from all across India closing their shops for the entire day, demanding action from the government. The Maharashtra Food and Drug Administration had also raided 27 online pharmacies and filed a First Information Report against a popular e-commerce platform and its CEO. The Madras High Court e-pharmacy case mentioned above was also instituted by the Tamil Nadu Chemists and Druggists Association to prevent e-pharmacies from functioning in the state.

10. Government initiatives

I. National Digital Health Authority ("NeHA")

NeHA, which is the brainchild of the Ministry of Health and Family Welfare, is a proposed authority that is intended to be responsible for the development of an integrated health information system in India. It will be the nodal authority that will develop an integrated health information system along with the application of telemedicine and mobile health by collaborating with various stakeholders. Apart from this, it will also be responsible for enforcing the laws and regulations relating to the privacy and security of the patients’ health and information records.

NeHA is proposed to be a promotional, regulatory and standards setting organization to guide and support India’s journey in Digital Health and consequent realization of benefits of ICT intervention in the health sector in an orderly way. It also spells out the proposed functions and governance mechanism of NeHA.74

II. State Initiatives

The Gujarat government has started the initiative ‘E-Olakh’, which is developed for recording and registering births, deaths, and compilation of records. The primary aim is to maintain a database of birth and death records and issue birth and death certificates.75

The Chhattisgarh government, with the help of the Indian Space Research Organisation ("ISRO"), has linked government medical colleges at Raipur and Bilaspur which have in turn been linked with premier hospitals across the country creating a statewide network.76

30 such nodes have also been set up in Karnataka in collaboration with ISRO. The ISRO is also deploying telemedicine nodes under the ‘gramsat scheme’. Along with various state governments, the ISRO has managed to establish a vast telemedicine network that consists of 225 hospitals that are connected to 40 super specialty hospitals. The Andaman and Nicobar Islands are also now linked through satellite connectivity.77

III. Proposed Legislation

The proposed Digital Information Security in Healthcare Act (“DISHA”) as well as the Personal Data Protection Bill 2018 (“PDP 2018”) are the two major proposed legislation in the Digital Health space. DISHA is the legislation that seeks to formally establish NeHA and facilitate the online exchange of patient information with a view to prevent duplication of work and streamline resources.

The PDP Bill 2018 in its current form requires sensitive personal data e.g. medical records to be processed only with the explicit consent of the data principal or to respond to a medical emergency involving a threat to the life or a severe threat to the health of the data principal or any other individual. Moreover, it puts into place data localization requirements under which all Data Fiduciaries i.e. organizations such as government and corporations collecting data must store at least one copy of all personal data on a server/data centre located in India. Data designated as critical data by the Indian Government can only be stored in India.

IV. National Intellectual Property Rights Policy (“NIPR”)

The Department of Industrial Policy and Promotion (“DIPP”) released the NIPR on May 12, 2016, after receiving approval from the cabinet ministry. The NIPR, themed ‘Creative India; Innovative India’, focuses on creating awareness on the importance of IPR as a marketable financial asset and economic tool and lays down seven broad objectives ranging from awareness creation to strengthening the enforcement and adjudication mechanisms for combating infringement.

The NIPR recognizes the potential for innovation that exists in new and emerging technologies like nano-technology, biotechnology, agribiotech, life sciences, green technologies, telecommunications, new materials, space technologies, etc. The policy also talks about developing novel technology platforms in order to ensure enhanced access to affordable medicines and other healthcare solutions.

78. Objective 5 of the NIPR
79. Objective 5.8 of the NIPR
**11. Recommendations**

The uncertain environment in which Digital Health players are currently operating has made it difficult to effectively perform such services. At the same time, it also acts as a deterring factor for new entrants to venture into this field. It has become abundantly clear that the large scale adoption of Digital Health is the need of the hour in a country whose population is in need of better access to healthcare.

Some of the policy changes that would go a long way in ensuring the smooth adoption of Digital Health services in India include addressing conventional jurisdictional issues in cross-state and cross-border activities as well as developing a solid framework within which services can function. For cross-state telemedicine consultations, an efficient solution could be the implementation of a central level special licensing system for medical practitioners administered by the MCI (and eventually the NMC). Such licensing could have pre-requisites such as certification in telemedicine issued by a notified certification agency. The issuance of a special license at the central level would enable medical practitioners to practice across state borders, which is a fundamental element in the provision of services such as telemedicine.

The government could also engage in discussions with foreign jurisdictions to come up with a framework in which Indian qualified doctors can provide medical services to patients situated outside of India. In this way, India could help other countries that are currently in need of healthcare services, as well as allow for the provision of such services by foreign practitioners to patients situated in India.

Standards could also be laid down for e-Prescriptions and the manner in which such documents are required to be maintained in order for it to be considered valid. In certain countries, it has been found that the use of e-prescriptions have in fact reduced the misuse of prescriptions by patients, since there would be definitive records of dispensations against a prescription. These methods, while still in early stages of implementation, seem to have benefitted jurisdictions such as USA, and may be able to address some of the issues the Indian Digital Health industry is facing today.
12. Conclusion

The Digital Health market presents a lot of opportunities, but with every opportunity, there are bound to be risks involved. Innovation in this sector is yet to reach a saturation point, with new products frequently being introduced in the market. The legislative framework to protect and regulate such developments will remain one step behind, as it is yet to be seen how the industry will mature. Regardless, regulators have taken note of the restrictions and in many cases, the absence, of the law and are striving to formulate forward looking policies and legislations. The NIPR is only one such example.

In a country where access to affordable healthcare is still a looming issue, the public stands to gain immensely from the development of the Digital Health industry. With the public interest in the minds of both the regulators as well as the innovators, it remains to be seen if the developing legal and regulatory framework of the nation will impede or ignite its growth. While there is a long way to go, it is hoped that the overall positive outlook and support that the industry is receiving will continue and sustain itself in the future.
Annexure A

Telemedicine Scenarios

I. Important Components of the Process of Telemedicine

a. **Patient**: The individual who requires Tele-consultation.

b. **Primary Doctor**: The registered medical practitioner who has physical access to the Patient. The Primary Doctor will be available at the TCC (defined below).

c. **Specialist**: The registered medical practitioner who provides medical consultation to the Patient from over a distance. A Specialist is located at Telemedicine Specialty Centre.

d. **Telemedicine System**: The system / technology created in order to store, transmit and control all the information / data of the patient [(e.g. the Electronic Medical Record (“EMR”) from the Patient to the Specialist, via TCC and TSC (defined below)].

e. **Telemedicine Consultancy Centre (“TCC”)**: The medical facility where the patient is present. The TCC will be equipped with basic technology required for exchange of medical information and medical consultation.

f. **Telemedicine Specialty Centre (“TSC”)**: The medical facility where the Specialist is present. Like the Telemedicine Consultancy Center, this facility will be equipped with basic technology required for exchange of medical information and medical consultation. The specialist will provide Tele-consultancy from the TSC.

g. **Tele-consultation**: The delivery of health care services using information and communication technology over a distance.

II. Scenarios

A. Telemedicine between Patient and Specialist via the Primary Doctor

i. The patient goes to the TCC to receive expert advice of the Specialist who is located at the TSC.

ii. The TCC houses a Primary Doctor who examines the Patient and sends report of his examination to the TSC.

iii. The health information of the patient is shared real time (synchronously) or in a specific format (asynchronously, e.g. EMR), to the TSC via a Telemedicine System. The Telemedicine System permanently stores all health related information.

iv. The specialist present at the TSC examines the health information and gives his or her expert consultation/advice.

v. The expert advice is relayed real time (synchronously) or in a specific format (Doctor Opinion) to the TCC, via the Telemedicine System. In either event, it is stored permanently in the Telemedicine System.

vi. The Primary Doctor at TCC receives the expert advice and treats the Patient accordingly.
B. Telemedicine between Patient and Specialist without the Primary Doctor

i. The patient goes to the TCC to receive expert advice of the Specialist who is located at the TSC.

ii. The health information of the patient is shared real time (synchronously) or in a specific format (asynchronously, e.g. EMR), to the TSC via a Telemedicine System. The Telemedicine System permanently stores all health related information.

iii. The specialist present at the TSC examines the health information and gives his or her expert consultation/advice.

iv. The expert advice is relayed real time (synchronously) or in a specific format (Doctor Opinion) to the TCC, via the Telemedicine System. In either event, it is stored permanently at the Telemedicine System.

v. The patient is directly treated by the Specialist.
C. Telemedicine between the Doctors

i. The health information of the patient is shared in a specific format (asynchronously, e.g. EMR), to the TSC via a Telemedicine System. The Telemedicine System permanently stores all health related information.

ii. The Specialist present at the TSC examines the health information and gives his or her expert consultation/advice.

iii. The expert advice is relayed in a specific format (Doctor's Opinion) to the TCC, via the Telemedicine System. It is stored permanently at the Telemedicine System.

Research is the DNA of NDA. In early 1980s, our firm emerged from an extensive, and then pioneering, research by Nishith M. Desai on the taxation of cross-border transactions. The research book written by him provided the foundation for our international tax practice. Since then, we have relied upon research to be the cornerstone of our practice development. Today, research is fully ingrained in the firm’s culture.

Our dedication to research has been instrumental in creating thought leadership in various areas of law and public policy. Through research, we develop intellectual capital and leverage it actively for both our clients and the development of our associates. We use research to discover new thinking, approaches, skills and reflections on jurisprudence, and ultimately deliver superior value to our clients. Over time, we have embedded a culture and built processes of learning through research that give us a robust edge in providing best quality advices and services to our clients, to our fraternity and to the community at large.

Every member of the firm is required to participate in research activities. The seeds of research are typically sown in hour-long continuing education sessions conducted every day as the first thing in the morning. Free interactions in these sessions help associates identify new legal, regulatory, technological and business trends that require intellectual investigation from the legal and tax perspectives. Then, one or few associates take up an emerging trend or issue under the guidance of seniors and put it through our “Anticipate-Prepare-Deliver” research model.

As the first step, they would conduct a capsule research, which involves a quick analysis of readily available secondary data. Often such basic research provides valuable insights and creates broader understanding of the issue for the involved associates, who in turn would disseminate it to other associates through tacit and explicit knowledge exchange processes. For us, knowledge sharing is as important an attribute as knowledge acquisition.

When the issue requires further investigation, we develop an extensive research paper. Often we collect our own primary data when we feel the issue demands going deep to the root or when we find gaps in secondary data. In some cases, we have even taken up multi-year research projects to investigate every aspect of the topic and build unparallel mastery. Our TMT practice, IP practice, Pharma & Healthcare/Med-Tech and Medical Device, practice and energy sector practice have emerged from such projects. Research in essence graduates to Knowledge, and finally to Intellectual Property.

Over the years, we have produced some outstanding research papers, articles, webinars and talks. Almost on daily basis, we analyze and offer our perspective on latest legal developments through our regular “Hotlines”, which go out to our clients and fraternity. These Hotlines provide immediate awareness and quick reference, and have been eagerly received. We also provide expanded commentary on issues through detailed articles for publication in newspapers and periodicals for dissemination to wider audience. Our Lab Reports dissect and analyze a published, distinctive legal transaction using multiple lenses and offer various perspectives, including some even overlooked by the executors of the transaction. We regularly write extensive research articles and disseminate them through our website. Our research has also contributed to public policy discourse, helped state and central governments in drafting statutes, and provided regulators with much needed comparative research for rule making. Our discourses on Taxation of eCommerce, Arbitration, and Direct Tax Code have been widely acknowledged.

Although we invest heavily in terms of time and expenses in our research activities, we are happy to provide unlimited access to our research to our clients and the community for greater good.

As we continue to grow through our research-based approach, we now have established an exclusive four-acre, state-of-the-art research center, just a 45-minute ferry ride from Mumbai but in the middle of verdant hills of reclusive Alibaug-Raigadh district. Imaginarium AliGunjan is a platform for creative thinking; an apolitical ecosystem that connects multi-disciplinary threads of ideas, innovation and imagination. Designed to inspire ‘blue sky’ thinking, research, exploration and synthesis, reflections and communication, it aims to bring in wholeness – that leads to answers to the biggest challenges of our time and beyond. It seeks to be a bridge that connects the futuristic advancements of diverse disciplines. It offers a space, both virtually and literally, for integration and synthesis of knowhow and innovation from various streams and serves as a dais to internationally renowned professionals to share their expertise and experience with our associates and select clients.

We would love to hear your suggestions on our research reports. Please feel free to contact us at research@nishithdesai.com
